

A guide for patients and carers in using Nyxoid® Nasal Spray to reverse an opioid overdose.

Your doctor or pharmacist has recommended that you carry Nyxoid® nasal spray

What is in a pack of Nyxoid®?

A Consumer Medicine Information (CMI) leaflet.

Two blister packs, each containing a nasal spray single-dose unit.

A Quick Start Guide is printed on the back of the blister pack with pictograms showing how to use Nyxoid® nasal spray.

What is Nyxoid®?

Nyxoid® is a single-dose nasal spray used as part of the emergency treatment of an overdose of heroin or other opioid drugs. Each pack contains 2 nasal sprays (2 single doses).

Signs of overdose include breathing problems. severe sleepiness, and not responding to a loud noise or touch.

Nyxoid® is designed as an emergency rescue treatment only; you must get emergency medical attention as soon as possible after its use.

Nyxoid® should be carried by anyone at risk of overdosing on an opioid. Carers such as close family or friends should know where to find Nyxoid® in case of emergency.

When to use Nyxoid®

If you know or suspect that someone has overdosed on an opioid drug, use Nyxoid® as described on the other side of this leaflet.

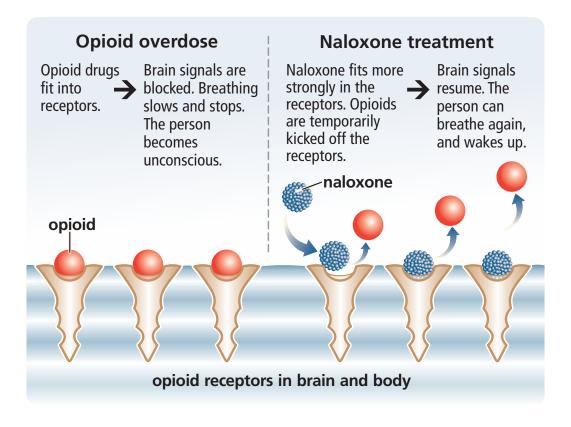

- ! ALWAYS call an ambulance immediately, even if the person wakes up they may become unconscious again, and stop breathing.
- **Take care**: a person treated with Nyxoid® may show acute withdrawal symptoms, which can be dangerous.

If you carry Nyxoid®...

Set an alert in your calendar for 1 month before your Nyxoid® is due to expire. Then arrange for a replacement.

How does Nyxoid® work?

Nyxoid® contains **naloxone**, which temporarily reverses the effect of opioid drugs. Naloxone works by displacing opioid drug molecules from their receptors in the brain and body.

1 Check for signs of overdose

- Approach with care. Check for dangers, such as injecting materials that might be lying around
- Check for a response, to see if the person is conscious. You can:
 - shout their name
 - · gently shake their shoulders
 - · talk loudly into their ear
 - rub their breastbone (sternum)
 - pinch their ear or the bed of their fingernail
- Check airways and breathing
 - Clear the mouth and nose of any blockages
 - For 10 seconds, check for breathing Is the chest moving? Can you hear breathing sounds? Can you feel breath on the cheek?
- Check for signs of overdose, such as:
 - no response to touch or sounds
 - slow, uneven breathing or no breathing
 - · snoring, gasping or gulping
 - · blue or purple fingernails or lips

Call an ambulance 000

Always call for emergency services immediately, even if the person wakes up.

Nyxoid is not a substitute for emergency medical care or basic life support (such as CPR).

- Put your phone in loudspeaker mode if possible, to keep your hands free
- Give emergency services as much information as you can, including:
- your exact location and postcode (if known)
- what substances you think the person may have taken
- whether they are conscious and breathing
- that you plan to give Nyxoid® nasal spray

3 Give Nyxoid if you know or suspect an opioid overdose

Each nasal spray contains one dose only.

Lay the person on their back. Support the back of the neck, and let the head tilt back. Check that the nose is clear before giving Nyxoid®. If it is blocked, use a tissue to clear the nose

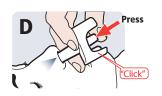

Peel off the back of the Nyxoid container. Remove the nasal spray and place it within easy reach.

Hold the spray as shown first two fingers either side of the nozzle, thumb ready to push the plunger.

Don't press to prime or test before use.

Gently insert the spray nozzle into one nostril. Press firmly on the plunger until it clicks and gives the dose. Remove the nozzle from the nostril. If possible, note

which nostril you used.

4 Put into recovery position

Place nearest arm at right angle to body, with arm bent

Bring other arm across chest Place back of person's hand against cheek

Grasp far leg just above knee Lift knee Roll person towards you, onto their side

Support head, keeping

back of hand against cheek

Final position: D Hand supports head

Top leg bent at hip and knee. Their mouth should be open pointing towards the ground

5 Monitor until help arrives

- Stay with the person. Watch for an improvement in breathing, alertness, and their response to sound and touch.
- Be aware even if they wake up, they may become unconscious again, and stop breathing.

6 Lack of response within 2 - 3 minutes give 2nd dose

- If there's no improvement after 2–3 minutes, or if overdose symptoms come back: **use a new Nyxoid® nasal spray in the other nostril**. (Repeat Step 3). You can do this while the person is in the recovery position.
- If the person is unconscious and not breathing normally, give basic life support (such as CPR) if you are trained to do so.*
- Once the patient is breathing normally, do not administer further doses of Nyxoid®.

7 Take care for your own safety

- Nyxoid® can cause **acute withdrawal symptoms** if the person is dependent on opioid drugs Symptoms can include:
 - body aches and cramps
 - vomiting, nausea, diarrhoea
 - · fever, runny nose or sneezing
 - sweating, shivering or trembling
 - nervousness or irritability

Some people may seem to act aggressively as they wake up.

Take care for your own safety.

8 When the ambulance arrives

• Immediately tell them what has happened and that you have given Nyxoid®. Give them any used Nyxoid® nasal spray(s).

Disposal of used nasal sprays

If you forget to give the used sprays to the paramedics, pass them to a healthcare professional or pharmacist, and arrange for replacements. **Never** throw away the sprays in water waste or household waste.

*For more information about training in basic life support, refer to the **Australian Resuscitation Council** https://resus.org.au or Healthdirect https://www.healthdirect.gov.au/how-to-perform-cpr
